

The
POWER of
DEPENDABILITY

Custom solutions for a confident tomorrow

STAY CONFIDENT WITH DEPENDABLE POWER

Power outages are more than just a headache. Spoiled food, frozen pipes, and emergency supplies can put a significant dent in your budget. In fact, power outages cost American households \$150 billion annually. In addition, a failed well pump, inoperable electric garage door, or downed security system may threaten your health and safety.

What's the most reliable way to assure peace of mind for you and your family during the next power outage?

Portable generators are generally designed for camping or other outdoor uses and often require cords, gasoline, and a manual startup. A standby generator is designed for quiet operation, is more environmentally friendly, and automatically turns on when the power goes out.

GENERATOR CHOICES: PORTABLE VS. STANDBY

	PORTABLE	STANDBY
Gasoline- or diesel-powered engine	✓	
Natural gas or propane-powered engine		✓
Noise-reduction technology		✓
Requires cords from generator to house	✓	
Requires manual start	✓	
Automatic start		✓

THE KEY QUESTION: WHAT SIZE GENERATOR DO YOU NEED?

Many companies just automatically match the generator size to the kilowatts coming into your house. That approach may work if you want to power your whole house, but it also means you will overspend if you only need to power specific functions, such as your heating or cooling system, refrigerator, and stove.

The first step in deciding on the size of a generator is to determine what you want to function in the case of a power outage. Use the worksheet to help right size your generator.

WHAT ITEMS DO YOU NEED TO POWER IN CASE OF AN OUTAGE?

The experts at Palmer Generator have years of experience creating customized backup power solutions for homes, businesses, and industry. Our team will be happy to review your specific power needs and recommend the best generator for you.

- Heating
- Air Conditioning
